CDC Recommendations for HIV Testing in Healthcare Settings

Routine voluntary testing for patients ages 13 to 64 y
Not based on patient risk

Opt-out testing

No separate consent for HIV

Resulting in increases in HIV testing rates

Pretest counseling not required

Repeat HIV testing left to discretion
of provider, based on risk

Within the US, 34 states are neutral
to supportive of the CDC guidelines
while 11 states have taken steps
to reduce regulatory barriers

6 states passed legislation (2007)

screening για ΤΒ, ηπατίτιδες

	Assessment	At HIV diagnosis	Prior to starting ART	Follow-up frequency	Comment	See page
Viral Hepatitis	HAV screen	+		As indicated	Screen if ongoing risk (e.g. MSM); vaccinate if non-immune	79, 95-97
	HBV screen	+	+		Annual screen if ongoing risk; vaccinate if non-immune. Use ART containing TDF or TAF in vaccine non-responders	
	HCV screen	+			Further screen based on risk behaviour and local epidemiology. Measure HCV-RNA if HCV Ab pos or if recently acquired infection suspected	
	HDV screen			As indicated	All Persons with positive HBs-Ag should also be screened for HDV co-infection	95, 103
	HEV screen			As indicated	Screen persons with symptoms consistent with acute hepatitis, unexplained flares of aminotransferases or elevated liver function tests, neuralgic amyotrophy, Guillain-Barré, encephalitis or proteinuria. Include anti-HEV IgG and IgM and NAT for HEV-RNA in blood and if possible in stool	103
Tuberculosis	CXR	+		Re-screen if exposure	Consider routine CXR in persons from high TB prevalence populations. Some national guidelines consider the ethnicity, CD4 count and ART usage to define indication for latent tuberculosis infection screening. Use of PPD/IGRA depending on availability and local standard of care. IGRA should, however, be tested before PPD if both are to be used, given the potential for a false positive IGRA after PPD. See Diagnosis and Treatment of TB in PLWH	20, 114
	PPD	+				
	IGRA in selected high-risk populations (if available)	+				

screening για άλλες συλλοιμώξεις

	Assessment	At HIV diagnosis	Prior to starting ART	Follow-up frequency	Comment	See page
Others	Varicella zoster virus serology	+			Offer vaccination where indicated	79
	Measles/Rubella serology	+			Offer vaccination where indicated	
	Toxoplasmosis serology	+				
	CMV serology	+				79
	Cryptococcus antigen	+/-			Consider screening for cryptococcus antigen in serum in persons with CD4 count < 100 cells/μL	
	Leishmania serology	+/-			Screen according to travel history/origin	
	Tropical screen (e.g. Schistosoma serology)	+/-			Screen according to travel history/origin	
	Influenza virus	+		Annual	In all PLWH, see Vaccination	79
	<i>Streptococcus pneumoniae</i>	+			No recommendations available regarding the need for a booster dose, see Vaccination	79
Human papilloma virus	+		As indicated	Vaccinate all PLWH with 3 doses between ages 9 and 40. If HPV infection is established, efficacy of vaccine is questionable, see Vaccination	79	

Vaccination

- Vaccinate according to national guidelines for healthy population, preferably after having achieved suppressed viraemia and immune reconstitution (CD4 count > 200 cells/ μ L)
 - Consider repeating vaccinations performed at CD4 count < 200 cells/ μ L (< 14%) or unsuppressed viraemia once adequate immune reconstitution is achieved (HIV-VL undetectable and CD4 count > 200 cells/ μ L)
 - As vaccine responses may be significantly lower in PLWH (i.e. lower seroconversion rates, faster titer decline), do not use rapid schedules and consider antibody titers to assess their effectiveness if vaccinated at CD4 count < 200 cells/ μ L or unsuppressed viraemia (e.g. rabies, tick-borne encephalitis, HAV, meningococci)
 - Avoid polysaccharide vaccination
 - For background data, see <http://www.bhiva.org/vaccination-guidelines.aspx>
- For attenuated live vaccines⁽ⁱ⁾
(in addition to restrictions for general population):
 - ***Varicella, measles, mumps, rubella, yellow fever**
Contraindicated if CD4 count < 200 cells/ μ L (14%) and/or AIDS. Impaired protection after vaccination with unsuppressed viraemia
 - **Oral live typhoid**
Contraindicated if CD4 count < 200 cells/ μ L (14%): give inactivated parenteral polysaccharide vaccine. Preferred if CD4 count > 200 cells/ μ L (> 14%)

Vaccination

Infection	
Influenza Virus	Yearly
Human Papilloma Virus (HPV)	Vaccinate with 3 doses for all HIV-positive persons up to age 9 / age 40 if MSM. Use 9-valent vaccine if available.
Hepatitis B Virus (HBV)	Vaccinate if seronegative. Repeat doses until anti-HBs antibodies ≥ 10 IU/L / ≥ 100 IU/L
Hepatitis A Virus (HAV)	Vaccinate if seronegative. Weaker immune response expected with HAV/HBV co-vaccine.
<i>Neisseria meningitidis</i>	Use conjugated vaccine (2 doses 1-2 months apart) if available. Booster every five years if exposure continues. Polysaccharide vaccine not recommended anymore

Ανταπόκριση σε εμβολιασμό έναντι HBV σε συλλοίμωξη

87% σε CD4 > 500

33% σε CD4 200-500

Σε ασθενείς με χαμηλό αριθμό CD4 (< 200/ μ L)
και HIV ιαιμία, θα πρέπει προ του εμβολιασμού
να γίνεται έναρξη ART

Σε CD4 200-500, συστήνονται 4 δόσεις εμβολίου:
Μήνας 0, 1, 2, and 6-12

Σε μη ανταπόκριση, επανάληψη με 40 μ g (διπλή δόση)

Απώλεια προστατευτικών αντισωμάτων έως 30% /έτος

Vaccination

<p><i>Streptococcus pneumoniae</i></p>	<p>One dose of conjugated(iii) 13-valent vaccine (CPV-13) for all individuals, also if pre-vaccinated with PPV-23 polysaccharide vaccine. No general recommendation for any booster dose.</p>
<p>Varicella Zoster Virus (VZV)</p>	<p>Vaccinate if seronegative</p>
<p>Yellow Fever Virus</p>	<p>Contraindicated if past or current haematological neoplasia or thymus affection (thymoma, resection/radiation). Booster q 10 years.</p>

ORIGINAL RESEARCH

Acute systemic inflammation induced by influenza A (H1N1) vaccination causes a deterioration in endothelial function in HIV-infected patients

C Vlachopoulos,¹ P Xaplanteris,¹ H Sambatakou,² E Mariolis,² A Bratsas,¹ E Christoforidou,¹ A Miliou,¹ K Aznaouridis¹ and C Stefanadis¹

Conclusions

Acute systemic inflammation induced by vaccination against the influenza A/H1N1 virus resulted in a deterioration in endothelial function in HIV-infected patients, and this effect was sustained for at least 48 h. Our findings may have important implications in view of the high cardiovascular risk that HIV infection carries. The effect of the novel vaccine on endothelial function should be weighed against the immunological protection that it confers.

The NEW ENGLAND JOURNAL *of* MEDICINE

ESTABLISHED IN 1812

AUGUST 27, 2015

VOL. 373 NO. 9

Initiation of Antiretroviral Therapy in Early Asymptomatic HIV Infection

The INSIGHT START Study Group*

ation group be offered antiretroviral therapy. The primary end point occurred in 42 patients in the immediate-initiation group (1.8%; 0.60 events per 100 person-years), as compared with 96 patients in the deferred-initiation group (4.1%; 1.38 events per 100 person-years), for a hazard ratio of 0.43 (95% confidence interval [CI], 0.30 to 0.62; $P < 0.001$). Hazard ratios for serious AIDS-related and serious non-AIDS-related events were 0.28 (95% CI, 0.15 to 0.50; $P < 0.001$) and 0.61 (95%

CONCLUSIONS

The initiation of antiretroviral therapy in HIV-positive adults with a CD4+ count of more than 500 cells per cubic millimeter provided net benefits over starting such therapy in patients after the CD4+ count had declined to 350 cells per cubic millimeter. (Funded by the National Institute of Allergy and Infectious Diseases and others; START ClinicalTrials.gov number, NCT00867048.)

Έναρξη αντιρετροϊκής αγωγής ΤΩΡΑ

Με την διάγνωση, ανεξάρτητα από τον αριθμό των CD4 λεμφοκυττάρων

Guidelines for Treatment of HIV-Infected Pts

Guideline	AIDS or HIV-Related Symptoms	CD4+ Cell Count, cells/mm ³		
		< 350	350-500	> 500
EACS ^[1]	Yes	Yes	Yes	Yes
DHHS ^[2]	Yes	Yes	Yes	Yes
IAS-USA ^[3]	Yes	Yes	Yes	Yes
WHO ^[4]	Yes	Yes	Yes	Yes

ART initiation now recommended for all pts, regardless of CD4+ cell count

1. EACS HIV Guidelines. V 8.0. October 2015. 2. DHHS Guidelines. April 2015. 3. Günthard H, et al. JAMA. 2014;312:410-425. 4. WHO When to Start Guidelines. September 2015

Αντιρετροϊκή αγωγή συστήνεται για όλους τους HIV (+) ασθενείς, ανεξαρτήτως αριθμού CD4

- ✓ Σε ασθενείς με καιροσκοπικές λοιμώξεις, συστήνεται έναρξη ART εντός 2 εβδομάδων από τη διάγνωση
Εξαιρείται η κρυπτοκοκκική μηνιγγίτιδα, με σύσταση για καθυστέρηση έναρξης ART ≥ 4 εβδομάδες από την έναρξη αντιμυκητιακής αγωγής (κίνδυνος για απειλητικό για τη ζωή IRIS).
- ✓ Για έναρξη ART σε συλλοίμωξη με TB:
συστήνεται ως 1^η γραμμής ARV
TDF/FTC + RAL or TDF/FTC/EFV
< 50 cells/ μ L: Έναρξη ART το συντομότερο και εντός 2 εβδομ. από την έναρξη αντι-TB αγωγής.
 ≥ 50 cells/ μ L: Η ART μπορεί να καθυστερήσει έως 8 με 12 εβδομ από την έναρξη αντι-TB αγωγής

Should TDF-Based Regimens Still Be Considered as Initial Therapy?

Two-drug HIV therapy just as effective as three-drug therapy

EDITORIAL COMMENTARY

OXFORD

Rapid Antiretroviral Therapy: Time for a new Standard of Care

Susa Coffey,¹ Jason Halperin,² Aadia I. Rana,³ and Jonathan A. Colasanti^{4,5}

Clinical Infectious Diseases[®] 2020;

ART is recommended in all adults with chronic HIV infection, irrespective of CD4 counts¹⁰

- i ART is recommended irrespective of the CD4 count. In certain situations (i.e lower CD4 count or pregnancy), there is a greater urgency to start ART immediately
- In persons with OIs, ART initiation may have to be deferred, see page 104, for ART initiation in the presence of specific OIs. For ART initiation in persons with TB, see page 20
 - A possible exception to immediate start of ART might be HIV controllers, persons with high CD4 counts and HIV-VL < 1000 copies/mL, although even in such persons ART initiation has been shown to increase CD4 count, decrease inflammation, lower the risk of clinical events and prevent HIV transmission
 - Genotypic resistance testing is recommended prior to initiation of ART, ideally at the time of HIV diagnosis; otherwise before initiation of ART
 - If ART needs to be initiated before genotypic testing results are available, it is recommended to select a first-line regimen with a high barrier to resistance (e.g. a PI/b, DTG or BIC combined with TDF/FTC, TAF/FTC, TDF/3TC or ABC/3TC)
 - Whether rapid, possibly same-day ART start is proposed to newly diagnosed persons or postponed until complementary assessments depends on the setting and medical circumstances, medical indications to start ART more urgently and risk of loss from care. To reduce loss to follow-up between diagnosis and ART initiation, structural barriers delaying the process should be addressed

Recommended Regimens for Rapid ART

DHHS¹

Recommended Regimens

BIC/FTC/TAF

DTG + (TAF or TDF) + (3TC or FTC)
(DRV/RTV or DRV/COBI) + (TAF or
TDF) + (3TC or FTC)

Regimens Not Recommended

NNRTI-based regimens or DTG/3TC
due higher rate of transmitted NNRTI
and NTRI drug resistance

Regimens requiring ABC until HLA-
B*5701 test results received

EACS²

Recommended Regimens

BIC/FTC/TAF

DTG + TDF/FTC, TAF/FTC, TDF/3TC, or
ABC/3TC

Boosted PI + TDF/FTC, TAF/FTC,
TDF/3TC, or ABC/3TC

Regimens Not Recommended

DTG/3TC requires evaluation of
baseline laboratory test results before
initiation

Available 2-Drug Complete ART Regimens Without Sufficient Anti-HBV Activity

DTG/RPV¹:
Daily oral
tablet

DTG/3TC²:
Daily oral
tablet

LA CAB + RPV³:
Monthly IM
Injections

***DHHS⁴: When **switching ART in person with HIV/HBV**,
ARV drugs that are active against HBV should be **continued**;
discontinuing anti-HBV agents may cause serious hepatocellular damage
from
HBV reactivation; patients should be advised against stopping these
medications and be carefully monitored during HBV treatment
interruptions***

ART is recommended in all adults with chronic HIV infection, irrespective of CD4 counts¹⁰

- i ART is recommended irrespective of the CD4 count. In certain situations (i.e lower CD4 count or pregnancy), there is a greater urgency to start ART immediately
- In persons with OIs, ART initiation may have to be deferred, see page 104, for ART initiation in the presence of specific OIs. For ART initiation in persons with TB, see page 20
 - A possible exception to immediate start of ART might be HIV controllers, persons with high CD4 counts and HIV-VL < 1000 copies/mL, although even in such persons ART initiation has been shown to increase CD4 count, decrease inflammation, lower the risk of clinical events and prevent HIV transmission
 - Genotypic resistance testing is recommended prior to initiation of ART, ideally at the time of HIV diagnosis; otherwise before initiation of ART
 - If ART needs to be initiated before genotypic testing results are available, it is recommended to select a first-line regimen with a high barrier to resistance (e.g. a PI/b, DTG or BIC combined with TDF/FTC, TAF/FTC, TDF/3TC or ABC/3TC)
 - Whether rapid, possibly same-day ART start is proposed to newly diagnosed persons or postponed until complementary assessments depends on the setting and medical circumstances, medical indications to start ART more urgently and risk of loss from care. To reduce loss to follow-up between diagnosis and ART initiation, structural barriers delaying the process should be addressed

Assessing Barriers to Care and Treatment

Αντιρετροϊκή αγωγή συστήνεται για όλους τους HIV (+) ασθενείς, ανεξαρτήτως αριθμού CD4

- ✓ Σε ασθενείς με OIs, συστήνεται έναρξη ART εντός 2 εβδομάδων από τη διάγνωση
Εξαιρείται η κρυπτοκοκκική μηνιγγίτιδα, με σύσταση για καθυστέρηση έναρξης ART ≥ 4 εβδομάδες από την έναρξη αντιμυκητιακής αγωγής (κίνδυνος για απειλητικό για τη ζωή IRIS).
- ✓ Για έναρξη ART σε συλλοίμωξη με TB:
συστήνεται ως 1^η γραμμής ARV
TDF/FTC + RAL or TDF/FTC/EFV
< 50 cells/ μ L: Έναρξη ART το συντομότερο και εντός 2 εβδομ. από την έναρξη αντι-TB αγωγής.
 ≥ 50 cells/ μ L: Η ART μπορεί να καθυστερήσει έως 8 με 12 εβδομ από την έναρξη αντι-TB αγωγής

Ποια αντιρετροϊκή αγωγή επιλέγουμε?

Περίπτωση ασθενούς Ι

Ασθενής 47 ετών με νεοδιαγνωσθείσα HIV λοίμωξη τελικού σταδίου C3 (πνευμονία από *Pneumocystis jirovecii*)

Ιικό φορτίο: 120.000 cop/ml, CD4: 120

Υπερλιπιδαιμία (tot cholest: 240mg/dl, HDL: 39mg/dl)

ΑΠ: 136/90mmHg (δεν λαμβάνει αντιυπερτασική αγωγή)

Καπνιστής ~ 25 pack-yrs

BMI:29

Γονοτυπική αντοχή: wild type

Τι θα προτείνουμε για μεταβολικό σύνδρομο?

Τι είδους HAART θα χορηγήσουμε?

- Τι άλλο συμπληρωματικό έλεγχο χρειαζόμαστε?
- Έχει υπέρταση με βάση μία μέτρηση (συστήνω καταγραφή πρωί-βράδυ για 1 εβδομάδα)?
- Ποιός είναι ο καρδιαγγειακός κίνδυνος?
- Ποιός είναι ο καλύτερος προγνωστικός δείκτης στο γενικό πληθυσμό
- Θα πρέπει να ξεκινήσουμε αντιυπερτασικά, στατίνες κλπ ή αρχικά δίαιτα, άσκηση, διακοπή καπνίσματος και επαναξιολόγηση?
- Ποιοί είναι οι στόχοι της θεραπείας (φυσιολογικές τιμές?)
- Στην επιλογή α΄ γραμμής αντιυπερτασικών πόσο ρόλο παίζει νεαρής ηλικίας σε σχέση με μεσήλικες και άνω?

KA - ATP

Information about your risk score:

Age: 47

Gender: male

Total Cholesterol: 240 mg/dL

HDL Cholesterol: 39 mg/dL

Smoker: Yes

Systolic Blood Pressure: 136 mm/Hg

On medication for HBP: No

Risk Score* 19%

Means 19 of 100 people with this level of risk will have a heart attack in the next 10 years.

* Your risk score was calculated using an equation. Other NCEP products, such as printed ATP III materials, use a point system to determine a risk score that is close to the equation score.

Αφαίρεση του καπνίσματος....

Systolic Blood Pressure: 136 mm/Hg

On medication for HBP: No

Risk Score* 6%
Means 6 of 100 people with this level of risk will have

Εκτός από τη HAART...

A HIV-infected smokers lose more life-years to smoking than to HIV

2921 HIV patients and 10 642 controls were followed for 14 281 and 45 122 person-years, respectively

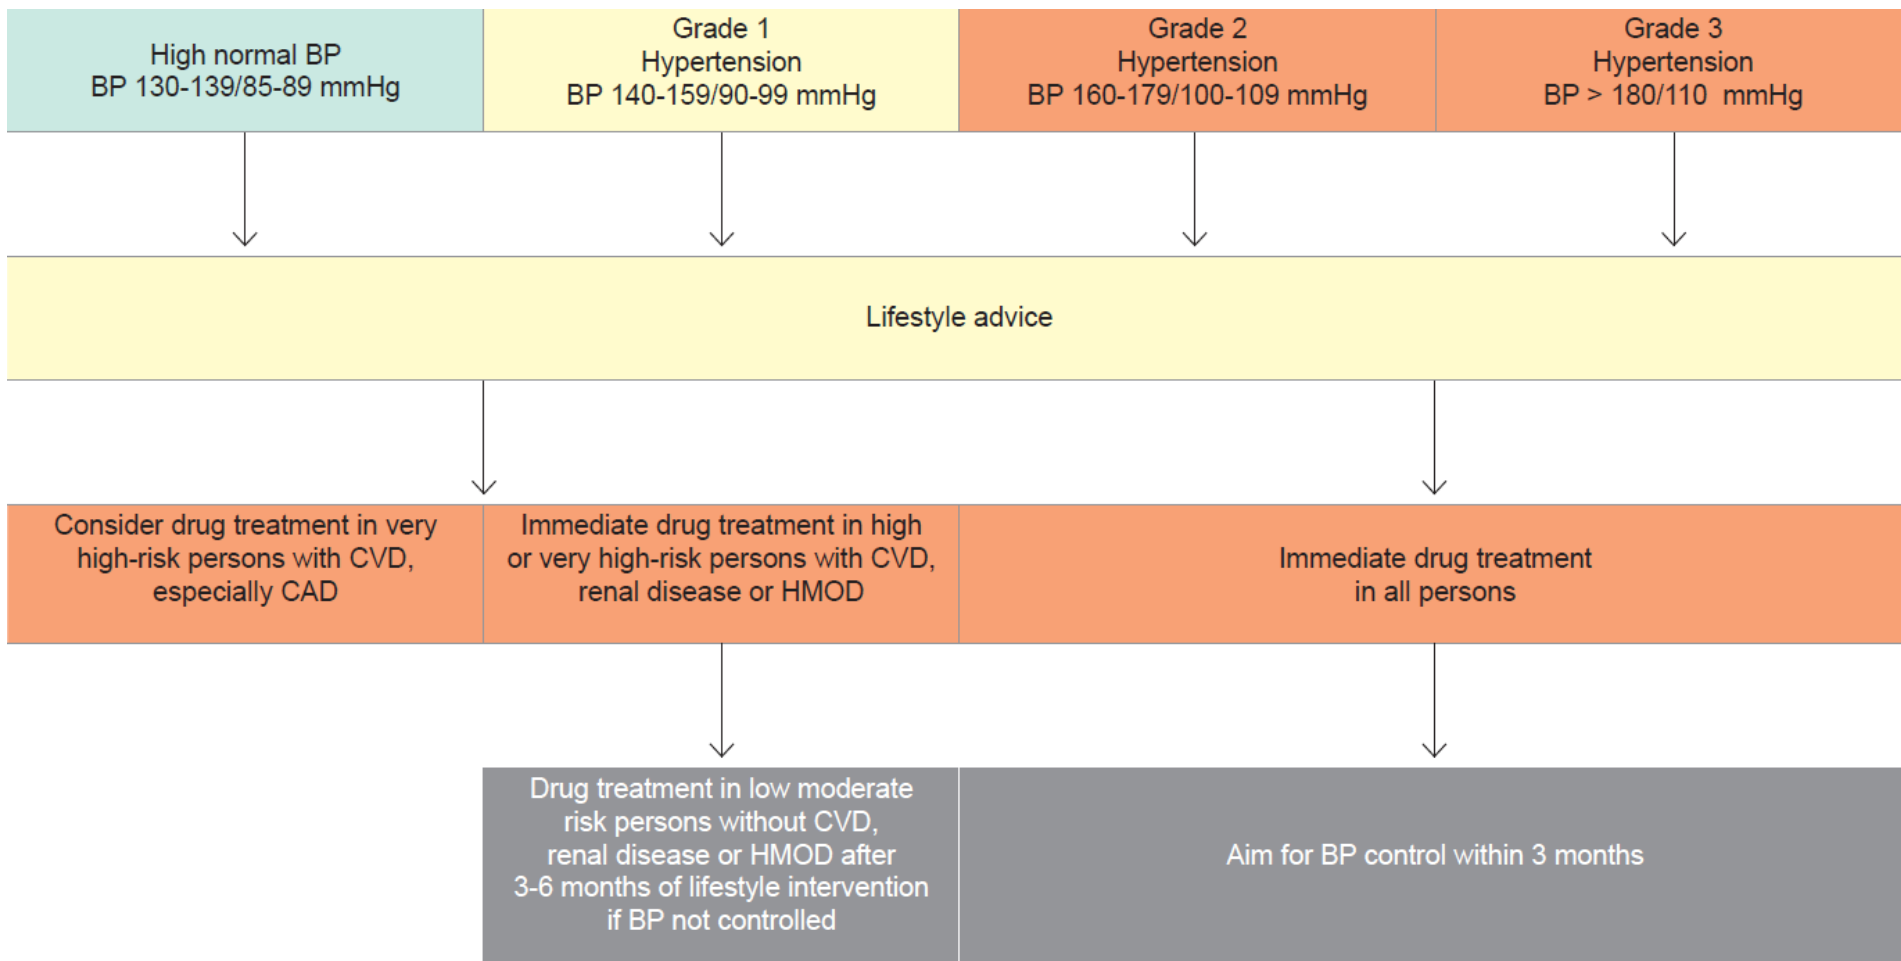

ΟΕΜ σε HIV (+) και HIV (-) ασθενείς

Cohorts (HIV+ =3851, HIV- =1,044,589) were identified in the Research Patient Data Registry.

The primary outcome was AMI.

Υπέρταση: Διάγνωση, διαβάθμιση και θεραπεία

Hypertension Management in Persons With HIV

< 55 Yrs of Age

≥ 55 Yrs of Age or Black (Any Age)

First Line*[†]

A: ACE inhibitor or angiotensin receptor blockers

C: Dihydropyridine calcium channel blocker[‡]

Second Line[†]

White: A + C

Black: A + C or C + thiazide-type diuretic (**D**)

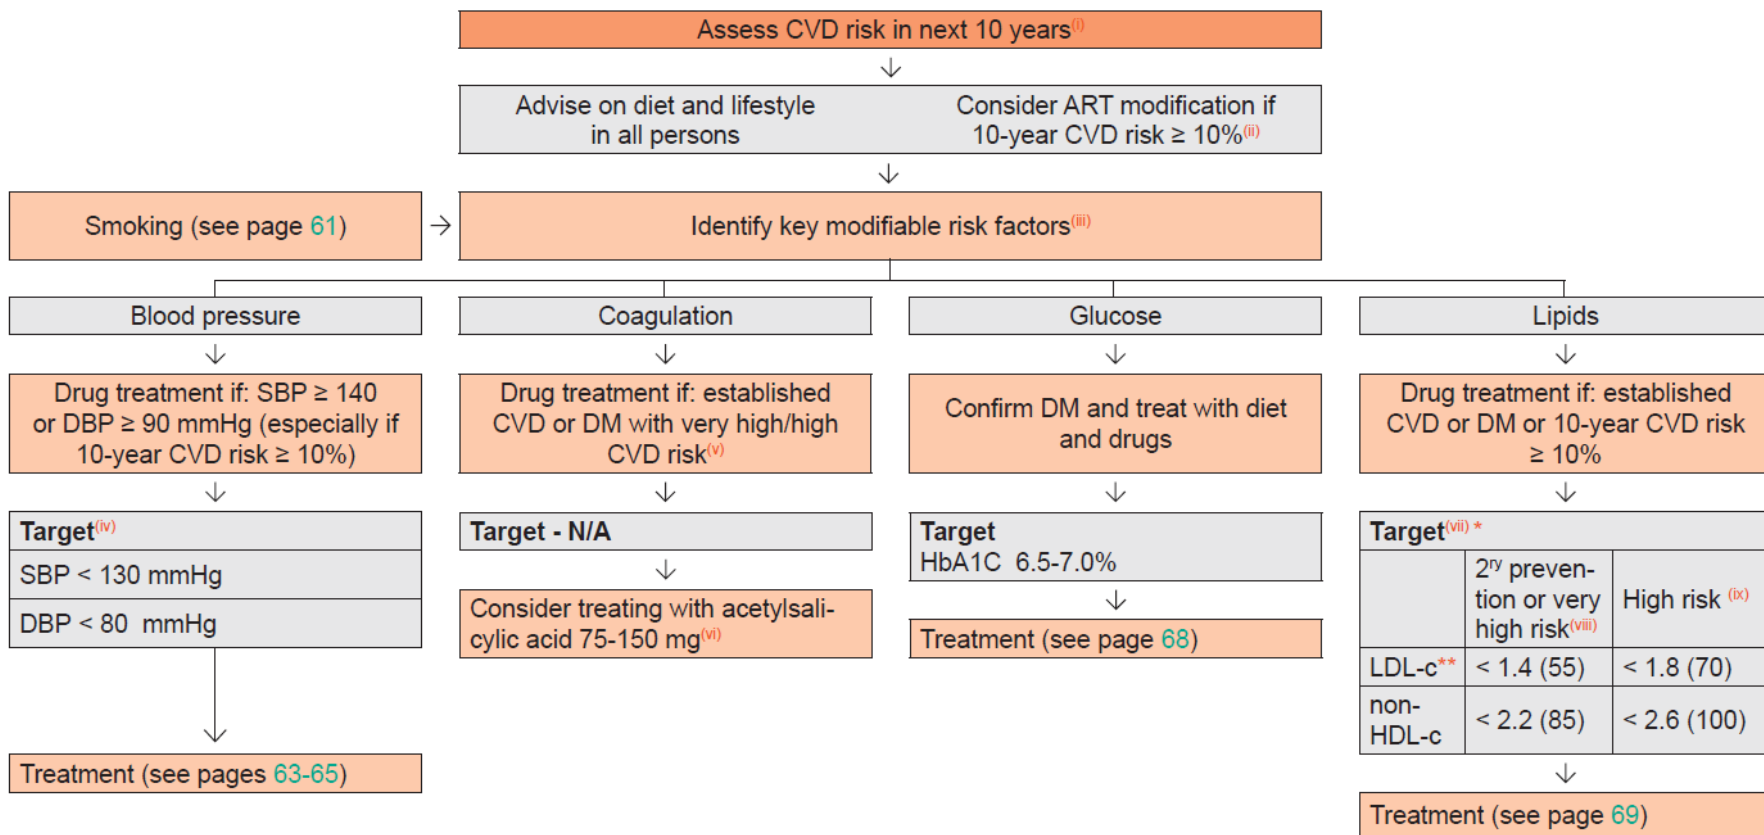

Third Line[†]

A + C + D + Spirolactone (12.5-50 mg)

Add α -blocker or β -blocker and refer to specialist

*2 antihypertensive drugs are increasingly recommended as first-line and second-line therapy, particularly if pretreatment SBP is ≥ 160 mm Hg. [†]Wait 4-6 wks to assess if target is achieved; if not, proceed to next step. [‡]If not tolerated or if deemed high risk of heart failure, a thiazide-type diuretic can be used instead. If dihydropyridine calcium channel blocker is preferred but not tolerated, verapamil or diltiazem may be used.

Πρόληψη καρδιαγγειακής νόσου (CVD)

Use Framingham equation or similar annually in all men with HIV > 40 yrs of age and all women with HIV > 50 yrs of age without CVD.

* Fasting or non-fasting samples may be used

** and $\geq 50\%$ reduction from baseline

†Replace with ARV known to cause less metabolic disturbances; consider replacing ZDV or ABC with TDF or use an NRTI-sparing regimen
